

Divvy Bikeshare - Lakehouse Star Schema

Azure Databricks - bronze Delta files to a gold star schema

dim_date and dim_rider are conformed: both fact tables key to them, so trip behaviour and payment behaviour can be compared on the same calendar and the same rider.

dim_station role-plays twice on fact_trip (start and end). Age at time of trip is a fact, not a rider attribute - it differs on every ride; age at account start is fixed, so it lives on dim_rider.
